

From Frontline Doctors

One of our latest is particularly good and features Dr. Peterson Pierre. It's called "No Good Reason to Jab Kids." Here are the 6 reasons not to jab your kids:

1. The Vaccines are Experimental—not FDA approved.
2. The Vaccines are not safe—over 1 million adverse events have been recorded, and over 40,000 deaths...
3. The Vaccines are not effective—they don't stop Covid and they don't stop transmission...
4. The Vaccines are not necessary—natural immunity is far safer and more effective...
5. Omnicom is mild...
6. Kids under 18 are 51 times more likely to die from the shot than they are to die from Covid if not vaccinated.

I encourage you to click below to check out FRONT LINE FLASH. This is news you won't hear anywhere else unless you tune into [FRONTLINE FLASH website](#).

New York Dept of health study

The kicker for childhood vaccines: the New York state Department of Health study of vaccine efficacy in children. After 2 months, efficacy in the 5- 11 year olds had fallen to 12%. In other words, 7 out of 8 vaccinated kids derived no benefit after 2 months, only risk. The data were derived from 365,000 children, and apparently there was no way CDC could spin them, or 12% was the best spin they could put on the data. This report is a huge obstacle to universal child vaccinations. They cabal cannot surmount i The odds for survival of this age group is 99.995% so why are injecting kids with an experimental vaccine is only 12% effective after 2 months??.
